CONTROLLABILITY OF DISCRETE LTI

Consider discrete LTI:

$$\mathbf{x}_{i+1} = \mathbf{A}\mathbf{x}_i + \mathbf{B}\mathbf{u}_i \tag{1}$$

Assume the initial state is \mathbf{x}_1 . Then we can deduce that:

$$egin{aligned} \mathbf{x}_2 &= \mathbf{A}\mathbf{x}_1 + \mathbf{B}\mathbf{u}_1 \ \mathbf{x}_3 &= \mathbf{A}\mathbf{x}_2 + \mathbf{B}\mathbf{u}_2 = \mathbf{A}(\mathbf{A}\mathbf{x}_1 + \mathbf{B}\mathbf{u}_1) + \mathbf{B}\mathbf{u}_2 \ \mathbf{x}_4 &= \mathbf{A}\mathbf{x}_3 + \mathbf{B}\mathbf{u}_3 = \mathbf{A}(\mathbf{A}(\mathbf{A}\mathbf{x}_1 + \mathbf{B}\mathbf{u}_1) + \mathbf{B}\mathbf{u}_2) + \mathbf{B}\mathbf{u}_3 \ &\dots \ \mathbf{x}_{n+1} &= \mathbf{A}^n\mathbf{x}_1 + \dots + \mathbf{A}^{n-k}\mathbf{B}\mathbf{u}_k + \dots + \mathbf{B}\mathbf{u}_n \end{aligned}$$

CONTROLLABILITY OF DISCRETE LTI

Controllability matrix

Equation $\mathbf{x}_{n+1} = \mathbf{A}^n \mathbf{x}_1 + ... + \mathbf{A}^{n-k} \mathbf{B} \mathbf{u}_k + ... \mathbf{B} \mathbf{u}_n$ can be re-written as:

$$\mathbf{x}_{n+1} - \mathbf{A}^{n} \mathbf{x}_{1} = \begin{bmatrix} \mathbf{B} & \mathbf{A} \mathbf{B} & \mathbf{A}^{2} \mathbf{B} & \dots & \mathbf{A}^{n-1} \mathbf{B} \end{bmatrix} \begin{bmatrix} \mathbf{u}_{k} \\ \mathbf{u}_{k-1} \\ \mathbf{u}_{k-2} \\ \dots \\ \mathbf{u}_{1} \end{bmatrix}$$
(2)

Notice that in order for the system to go from \mathbf{x}_1 to \mathbf{x}_{n+1} , it needs be in the column space of $\begin{bmatrix} \mathbf{B} & \mathbf{A}\mathbf{B} & \dots & \mathbf{A}^{n-1}\mathbf{B} \end{bmatrix}$.

CONTROLLABILITY OF DISCRETE LTI

Controllability criterion

Controllability

For a system $\mathbf{x}_{i+1} = \mathbf{A}\mathbf{x}_i + \mathbf{B}\mathbf{u}_i$, where $\mathbf{x} \in \mathbb{R}^n$, if the matrix $\mathcal{B} = \begin{bmatrix} \mathbf{B} & \mathbf{A}\mathbf{B} & \dots & \mathbf{A}^{n-1}\mathbf{B} \end{bmatrix}$ is full row rank (i.e. rank(\mathcal{B}) = n), any state can be reached, which means that the system is controllable.

Observability of Discrete LTI

Consider discrete LTI:

$$\begin{cases} \mathbf{x}_{i+1} = \mathbf{A}\mathbf{x}_i + \mathbf{B}\mathbf{u}_i \\ \mathbf{y}_i = \mathbf{C}\mathbf{x}_i \end{cases}$$
 (3)

And an observer:

$$\hat{\mathbf{x}}_{i+1} = \mathbf{A}\hat{\mathbf{x}}_i + \mathbf{B}\mathbf{u}_i + \mathbf{L}(\mathbf{y}_i - \mathbf{C}\hat{\mathbf{x}}_i)$$
 (4)

Remember that we can define observation error $\mathbf{e}_i = \hat{\mathbf{x}}_i - \mathbf{x}_i$ and white its dynamics:

$$\mathbf{e}_{i+1} = \mathbf{A}\mathbf{e}_i - \mathbf{L}\mathbf{C}\mathbf{e}_i \tag{5}$$

Dual system (which is stable if and only if the original is stable), has form:

$$\varepsilon_{i+1} = \mathbf{A}^{\mathsf{T}} \varepsilon_i - \mathbf{C}^{\mathsf{T}} \mathbf{L}^{\mathsf{T}} \varepsilon_i \tag{6}$$

OBSERVABILITY OF DISCRETE LTI

Dual system

Dynamical system $\varepsilon_{i+1} = \mathbf{A}^{\top} \varepsilon_i - \mathbf{C}^{\top} \mathbf{L}^{\top} \varepsilon_i$, we can be represented as:

$$\begin{cases} \varepsilon_{i+1} = \mathbf{A}^{\top} \varepsilon_i + \mathbf{C}^{\top} \mathbf{v}_i \\ \mathbf{v}_i = -\mathbf{L}^{\top} \varepsilon_i \end{cases}$$
 (7)

Controllability matrix of this system is:

$$C^{\top} = \begin{bmatrix} \mathbf{C}^{\top} & (\mathbf{A}^{\top})\mathbf{C}^{\top} & \dots & (\mathbf{A}^{\top})^{n-1}\mathbf{C}^{\top} \end{bmatrix}$$
(8)

It is easier to represent this matrix in its transposed form:

$$C = \begin{bmatrix} \mathbf{C} \\ \mathbf{C}\mathbf{A} \\ \dots \\ \mathbf{C}\mathbf{A}^{n-1} \end{bmatrix}$$
 (9)

Observability of Discrete LTI

Observability criterion

Observability

For a system
$$\mathbf{x}_{i+1} = \mathbf{A}\mathbf{x}_i + \mathbf{B}\mathbf{u}_i$$
 and $\mathbf{y}_i = \mathbf{C}\mathbf{x}_i$, where $\mathbf{x} \in \mathbb{R}^n$, if the matrix $C = \begin{bmatrix} \mathbf{C} \\ \mathbf{C}\mathbf{A} \\ ... \\ \mathbf{C}\mathbf{A}^{n-1} \end{bmatrix}$ is full column rank (i.e.

 $\operatorname{rank}(\mathcal{C}) = n$), observation error can go to zero from any initial position, which means that the system is observable.

CONTROL

"Unlimited control", part 1

Let's look at this equation one more time:

$$\mathbf{x}_{n+1} - \mathbf{A}^{n} \mathbf{x}_{1} = \begin{bmatrix} \mathbf{B} & \mathbf{A} \mathbf{B} & \mathbf{A}^{2} \mathbf{B} & \dots & \mathbf{A}^{n-1} \mathbf{B} \end{bmatrix} \begin{bmatrix} \mathbf{u}_{k} \\ \mathbf{u}_{k-1} \\ \mathbf{u}_{k-2} \\ \dots \\ \mathbf{u}_{1} \end{bmatrix}$$
(10)

If the system is controllable, it means every state can be reached from any other space in only n steps. This seem to disagree with our real-world experience.

CONTROL

"Unlimited control", part 2

Let's look at an even simpler equation $\mathbf{x}_{i+1} = \mathbf{A}\mathbf{x}_i + \mathbf{B}\mathbf{u}_i$. Let's rewrite the equation as follows:

$$\mathbf{x}_f - \mathbf{A}\mathbf{x}_1 = \mathbf{B}\mathbf{u}_1 \tag{11}$$

As long as $\mathbf{x}_f - \mathbf{A}\mathbf{x}_1$ lies in the column space of \mathbf{B} , it can be achieved in a single step, using control:

$$\mathbf{u}_1 = \mathbf{B}^+(\mathbf{x}_f - \mathbf{A}\mathbf{x}_1) \tag{12}$$

This as well, seem to disagree with our real-world experience.

LIMITED CONTROL

In the actual engineering reality we often have to deal with equations, that look closer to:

$$\begin{cases} \mathbf{x}_{i+1} = \mathbf{A}\mathbf{x}_i + \mathbf{B}\mathbf{u}_i \\ ||\mathbf{D}\mathbf{u}_i||_r \le 1 \end{cases}$$
 (13)

... which is a second-order cone program. Or:

$$\begin{cases} \mathbf{x}_{i+1} = \mathbf{A}\mathbf{x}_i + \mathbf{B}\mathbf{u}_i \\ \mathbf{D}\mathbf{u}_i \le \mathbf{d} \end{cases}$$
 (14)

... which is a quadratic program. Notice, those equations can't be solved analytically.
